REDUCING
OVERTIME
THROUGH
**SMART
EMPLOYEE
SCHEDULING**

Overtime costs companies millions

The issue of overtime work is among more serious challenges enterprises across industries encounter. Without full compliance with the labor law, **enterprises often face serious legal consequences**, which are not only measured in millions of dollars worth of fines but are also detrimental to the company reputation, both as a business partner and employer.

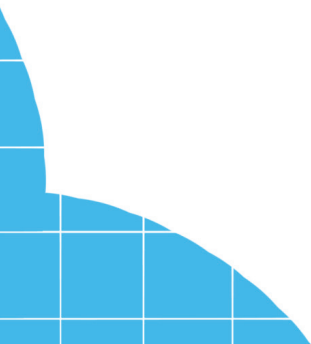

Many companies have faced **investigation for failing to compensate their staff properly**, having allegedly cut employee hours to avoid paying overtime, ignored off-the-clock work, allowed unpaid internships, or misclassified employees to avoid compensating for extra hours.

But the question of overtime work is deeper still—it is not only costly, but can give **rise to a toxic workplace**, one where managers try to shave off employee paychecks and skirt labor law, and where **employees resort to buddy clocking** and clock rounding as a response.

Enterprises often rely on finding a panacea for the issue only after the **effects of overtime hours have taken a toll** on employees and the company budget, which is often **too late and ineffective**.

Overtime hours can only be preempted, not remedied

The issue of overtime is two-fold—it puts a strain on the company budget but also **leads to workplace fatigue and eventually to employee disengagement**. To manage the issue of overtime hours effectively, enterprises need to take action early on—before the problem arises.

Overtime work is a direct consequence of poor workload management, which itself is a result of decision-making based on poor quality data and a lack of real-time insights into business demands and employee availability.

In today's business environment, **enterprises are not able to work efficiently without sound, data-driven management practices.** The only path to efficient reduction of overtime is through a data-based approach that **provides a clear overview of all business dependencies** and how they tie together.

Companies cannot afford to rely on antiquated, manual human capital management process, but rather need to upgrade to an **automated solution that can fully support the specificities of the company's business needs.**

Smart scheduling removes
the need for overtime work.

**Is your workforce
management software
smart enough?**

Start at the beginning: optimize talent utilization

Enterprises cannot allow being in the dark about upcoming staffing needs. They need to find a **solution that provides real-time insights into the team's bandwidth**, forthcoming business demands, and pending time off requests.

This would provide managers and scheduling professionals with enough time to create schedules around business needs and employee availability, and in turn, **eliminate the need for overtime hours, while staying compliant with labor law.**

While a proactive approach can help remove the need for overtime hours, sometimes companies simply need to put in the extra effort to meet customer demands. To manage this issue efficiently, **enterprises need to ensure a solution that facilitates real-time communication** and accurate time and attendance tracking.

Real-time communication would help teams navigate around last-minute schedule updates, while error-free time and attendance data would **secure fairness for all, and allow companies to automatically extract payroll ready timesheets.**

How shift scheduling platforms help reduce overtime

A cloud-based, data-driven scheduling platform gives the enterprise crucial information to make a timely call on upcoming workforce utilization. It provides **easy access to vital information in real-time**, including:

- Real-time access to employee availability and staffing needs
- Accurate, time and attendance data ready for payroll
- A single source of truth for all schedules across locations
- Real-time communication between all team members
- Compatibility with leading HCM software solutions
- Data on upcoming shifts accessible on-the-fly, via any device
- Optimized workforce utilization in line with skills and demand
