

TCP Multi-Language Feature

What Is It?

TCP's multi-language feature converts all the displayed language in the software and/or hardware to a language of either the individual or organization's choice. Our TimeClock Plus software offers conversions in French, Spanish and Vietnamese, allowing any native or preferred speakers of those languages to operate more comfortably in the daily workplace.

How Does It Work?

For Individuals

If most of the employees and managers in an organization speak or prefer one language, but one or a few individuals speak or prefer another language, they can easily log into the system and select their own language preference. From that point on, once the system identifies the employee or manager the display will automatically switch to their chosen language.

For Organizations

If the majority or entire organization organization speaks or prefers a language other than English, an administrator of the account can easily set the system's preference to another language. From then on, the system will regularly display the chosen language as opposed to English.

Why Does This Matter?

Accessibility is important. Daily processes shouldn't be a chore or hassle for managers or the workforce. Choosing a language that each individual is more comfortable with is one way to make both day-to-day operations and management easier and more efficient.
